Client: Jordan, Kristina (5058)

Patient Name: 900164001463765

Species: Canine

Breed:

~~XXXXXXXXXX~~
Weight: 29.40 lbs

Age: 5 Months

Doctor: Rebecca Morrison, DVM

Pet Vet Animal Hospital
2404 E Rock Haven Rd
Harrisonville, MO 64701

Test	Results	Reference Interval	LOW	NORMAL	HIGH
------	---------	--------------------	-----	--------	------

Catalyst Dx (July 3, 2018 11:32 AM)

TT4	2.1 µg/dL	1.0 - 4.0			
-----	-----------	-----------	--	--	--

Diagnostic Interpretation for TT4

< 1.0 µg/dL Low
1.0 - 2.0 µg/dL Low Normal
1.0 - 4.0 µg/dL Normal
> 4.0 µg/dL High
2.1 - 5.4 µg/dL Therapeutic

Dogs with no clinical signs of hypothyroidism and results within the normal reference range are likely euthyroid. Dogs with low T4 concentrations may be hypothyroid or "euthyroid sick". Occasionally, hypothyroid dogs can have T4 concentrations that are low normal. Dogs with clinical signs of hypothyroidism and low or low normal T4 concentrations may be evaluated further by submission of freeT4 (fT4) and canine TSH. A high T4 concentration in a clinically normal dog is likely a variation of normal; however elevations may occur secondary to thyroid auto antibodies or rarely thyroid neoplasia. For dogs on thyroid supplement, acceptable 4-6 hour post pill total T4 concentrations generally fall within the higher end or slightly above the reference range.

Date Submitted: 11 Sep 2020

Findings

Distraction Index (DI): Right DI = 0.62, Left DI = 0.64.
Osteoarthritis (OA): No radiographic evidence of OA for either hip.
Cavitation/Other Findings: No cavitation present.

Interpretation

Distraction Index (DI): The laxity ranking is based on the hip with the greater laxity (larger DI). In this case the DI used is 0.64.
OA Risk Category: The DI is between 0.50 and 0.69. This patient is at moderate risk for hip OA.
Distraction Index Chart:

GIANT SCHNAUZER

BREED STATISTICS: This interpretation is based on a cross-section of 373 canine patients of the GIANT SCHNAUZER breed in the AIS PennHIP database. The gray strip represents the central 90% range of DIs (0.27 - 0.71) for the breed. The breed average DI is 0.46 (solid square). The patient DI is the solid circle (0.64).

SUMMARY: The degree of laxity (DI = 0.64) falls within the central 90% range of DIs for the breed. This amount of hip laxity places the hip at a moderate risk to develop hip OA. No radiographic evidence of OA for either hip.
